

AlarmSuite

AlarmSuite: Reliable, Simple Setup for Your SCADA Alarming Needs

What is AlarmSuite?

AlarmSuite is a companion product created by Core Automation for Aveva Intouch, System Platform and iFix SCADA systems. Its purpose is to notify operators of alarms and forward their acknowledgements to the SCADA system. Alarms are added once to the SCADA, no duplication of Alarms in AlarmSuite, saving time and money and improving accuracy.

Why Choose AlarmSuite?

Simple Setup

Setting up AlarmSuite is straightforward: Automatically import the alarms & structures from your SCADA system, define operators and their contact methods, and create tailored alarm plans. New alarms are automatically added when using System Platform/iFix versions.

Powerful Alarm Plans

AlarmSuite enables robust alarm planning by associating plans with imported alarm areas, defining escalation rules, reporting times, severity and priority levels, allowing for flexible notifications and handling of alarms across different operators and areas.

Easy to understand Graphical Configuration

Alarm plans are created in a user-friendly graphical environment by dragging and dropping areas into a plan. Plans are only activated if alarms in the area meet criteria like alarm priority or time of occurrence as set in the plan.

Features

Supported Systems

- Aveva: Intouch & System Platform
- GE iFix
- AlarmSuite standalone to PLC
- MS Windows

Alarms

- SMS alarms & acknowledgement
- Android and Apple apps
- Email
- Hands free SMS acknowledgment

Phone Apps

- IOS and Android
- Alarm notifications
- Alarm acknowledgement
- Select on or off call
- Alarm history

Fair Licensing

- AlarmSuite's licensing model is based on the number of recipients you need to notify, not the number of alarms reported or tags interrogated
